

Here's a **5-minute presentation script** that sounds natural and is easy to remember. It matches your PPT.

Slide 1 – Introduction (30 seconds)

"Good morning everyone. Today I'm going to present on 'Applying the 80/20 Pareto Principle to Manage Time.' The main idea of this principle is that a small amount of our effort often produces the biggest results. If we focus on the right tasks instead of trying to do everything, we can improve our productivity and reduce stress."

Slide 2 – What is the Pareto Principle? (40 seconds)

"The Pareto Principle, also called the 80/20 Rule, was introduced by the Italian economist Vilfredo Pareto. It says that around 80% of our results come from 20% of our efforts. This isn't an exact rule, but it reminds us to focus on the few tasks that have the greatest impact. It is widely used in business, software development, project management, and even in our daily lives."

Slide 3 – Why Time Management Matters (35 seconds)

"Time is one resource that we cannot get back. Good time management helps us meet deadlines, reduce stress, and improve our work-life balance. Instead of spending equal time on every task, we should identify the important ones. Tracking our daily activities can help us understand where our time is being wasted."

Slide 4 – How to Apply the 80/20 Rule (50 seconds)

"Applying this principle is simple. First, make a list of all your daily tasks. Second, identify the 20% of tasks that will give the highest results. Third, prioritize those tasks and complete them first. Next, delegate or remove low-value activities if possible. Finally, review your progress every day. By following this cycle regularly, we can improve our productivity over time."

Slide 5 – Student Example (40 seconds)

"Let's take a student as an example. A student may study for eight hours every day, but if they study every topic equally, it may not give the best results. Instead, by focusing on high-weightage chapters, practicing previous-year questions, and revising important formulas, the student can score better marks with less stress. This is the power of the 80/20 rule."

Slide 6 – Software Engineer Example (40 seconds)

"The same principle applies in the IT industry. A software engineer has many responsibilities like attending meetings, replying to emails, coding, and fixing bugs. Instead of giving equal attention to everything, they should first solve critical bugs and customer-facing issues because these create the highest value. This leads to faster delivery, better productivity, and happier clients."

Slide 7 – Practical Tips & Benefits (45 seconds)

"Here are some practical ways to use the 80/20 rule every day. Create a list of your top three priorities, use the Eisenhower Matrix to separate important work from urgent work, follow the Pomodoro Technique to stay focused, and reduce distractions by limiting unnecessary notifications. These habits increase productivity, improve decision-making, reduce stress, and help maintain a better work-life balance."

Slide 8 & 9 – Challenges and Conclusion (1 minute)

"Of course, applying this principle isn't always easy. We may face interruptions, procrastination, too many meetings, or poor planning. These challenges can be overcome by planning our day, blocking time for focused work, avoiding unnecessary meetings, and reviewing our priorities regularly."

To conclude, the 80/20 Principle teaches us to work smarter, not harder. By focusing on the few tasks that create the biggest impact, we can achieve better results in less time. I hope this presentation has shown how this simple principle can improve both our studies and our professional life. Thank you. I'm happy to answer any questions."

If the trainer asks questions:

Q: Why is it called the 80/20 rule?

A: Because around 80% of results often come from 20% of the efforts.

Q: Can this be used in real life?

A: Yes. Students can focus on high-weightage topics, and employees can prioritize high-impact tasks to improve productivity.

This script will comfortably fit into **about 5 minutes** if you speak at a normal pace.
